/note="Grain: Pooled_Skin; Vector: pDNR-LIB; Site_I: SfiI
(ggccattafggcc); Site_2: SfiI (ggccgctcggcc); Library is
oligo-dT primed and directionally cloned. cDNA was
prepared from a pooled samples of tissues from Skin,
meninges, duramatter. pia matter and choroid plexus. 5,
adaptors were used in cloning as follows: 5,
adaptors sequence: 5'-CACGGCCATATATGCCC-3' and 3' adaptor
sequence: 5'-CACGGCCATATATGCCC-3' and 3' adaptor
(where B = A, C, or G and N = A, C, G, or T). Average
insert size I 147 kb (range 0.50-4.0 kb). 15/15 colonies
contained inserts by PCR. This library was enriched for
full-length clones and was constructed by Clontech
Libboratories (Palo Alto, CA). Note: this is a NIH_MGC

/note="Organ: Pooled-Skin; Vector: pDNR-LIB; Site_1: Sfil (ggcgctctggcc); Library is oligo-dT primed and directionally cloned. CDNA was prepared from a pooled samples of tissues from Skin, meninges, duramatter, pia matter and choroid plexus. 5' adaptors were used in cloning as follows: 5' adaptor sequence: 5'-ATTCTAGAGGCCGAGGCGACATG-dT(30)BN-3' (where B = A' C, or G and N = A, C, G, or T). Average insert size 1.47 kb (range 0.50-4.0 kb). IS/5 colonies contained inserts by PCR. This library was enriched for Liaboratories (Palo Alto, CA). Note: this is a NIH_MGC

The sequence contained an oligo-dr track that was present in the oligonuclectide that was used to prime the synthesis of first oligonuclectide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the CDNA between the NotI site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 (bases 1 to 636)

/clone="Vector: pT73D-Pac (Pharmacia) with a modified polylinker; Site 1: Not I; Site 2: Ecc R1; The UL-R-DR0 library is a non-normalized Rat_Osteoblast library constructed in pT3T7 PAC vector according to the procedure described by Bonaldo, Lennon & Soares (Genome Research Genome 6: 791-806, 1996). The oligonucleotide used to prime first strand synthesis contained the sequence tag CCAGG between the Not I cloning site and dT18 stretch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TTGTAACTGGTGGCTGGCCCGCATGCTGGGAGGGTCTAATAGGAGGTTTGAGCTCAAAT 1032

Equal amounts of plasmid DNA from five normalized
libraries were mixed, and ss circles were made in vitro.
Following HAP purification; this DNA was used as tracer in
a subtractive hybridization reaction. The driver was
pCR-amplified CDNAs from pools of 5,000 clones made from
the same 5 libraries. The pools consisted of the following
libraries and cloneIDs: Scares NBAFF pool 1:

/clonelib-Ty as subtracted library derived from an individually-tagged normalized whole-eye (minus the lens) individually-tagged normalized whole-eye (minus the lens) library. The driver for the subtraction consisted of a library of a libraries (UI-R-A0, UI-R-A1, UI-R-E0, UI-R-E1, UI-R-C0, and UI-R-C1). The tag is a string of UI-R-E1, UI-R-C0, and UI-R-C1). The tag is a string of origin of a clone within the mixture. The subtracted library (UI-R-Y0) was constructed as follows: PCR amplified cDNA inserts from previous library clones from which 3 ESTS had been derived were used as a driver in a hybridization with the normalized whole-eye library in the form of single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-Y0 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806, 1996)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized adult Eye library. cDNA Library Preparation: M. polylinker; Site 1: Not 1; Site 2: Eco R1; The U1-R-c1
library is a subtracted library derived from the U1-R-c1
library, which is a subtracted library derived from the U1-R-c1
libraries constructed from rat placenta, adult lung,
consisted of a mixture of individually tagged normalized
libraries constructed from rat placenta, adult lung,
brain, liver, kidney, heart, spleen, ovary, and muscle.
The U1-R-E1 library consisted of a mixture of
individually tagged normalized libraries constructed from
8, 12 and 18-day embryo. The tag is a string of 3-5
nucleotides present between the Not I site and the
of origin of a clone within the mixture. The subtracted
library (U1-R-C1) was constructed as follows: PCR
amplified cDNA inserts from U1-R-C0 clones from which 3'
ESTS had been derived was used as a driver in a
hybridization with the U1-R-C0 library in the form of
single-stranded circles. The remaining single-stranded
circles (subtracted library) was purified by
hydroxyapatite column chromatography, converted to
double-stranded circles and electroporated into DH10B
bacteria (Life Technologies) to generate the U1-R-C1
library. This procedure has been previously described

polylinker; Site_l: Not I; Site_2: Eco RI; The UI-R-Cl
library is a subtracted library derived from the UI-R-Al and UI-R-El libraries. The UI-R-Al library
UI-R-Al and UI-R-El libraries. The UI-R-Al library
consisted of a mixture of individually tagged normalized
libraries constructed from rat placenta, adult lung,
brain, liver, kidney, heart, spleen, ovary, and muscle.
The UI-R-El library consisted of a mixture of
individually tagged normalized libraries constructed from
nucleotides present between the Not I site and the
oligo-dr track which allows identification of the library
of origin of a clone within the mixture. The subtracted

The sequence contained an oligo-dT track that was present in the The sequence contained an oligo-dT track that was used to prime the synthesis of first oligonucleotide that was used to prime the synthesis of first oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A strand the sequence tag present in the CDNA between the NotI site tail. The sequence tag present in the CDNA between the NotI site and the oligo-dT track served to identify it as a clone from the normalized 18 day embryo library CDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Seq primer: MIS Forward.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AIS02787

library (UI-R-CI) was constructed as follows: PCR amplified cDNA inserts from UI-R-CO clones from which 3 ESTs had been derived was used as a driver in a hybridization with the UI-R-CO library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by
